ABSTRACT

This report presents information on weekly food expenditures per person and the percentage of households that purchased specific food items during a week. The report reveals that average weekly total food expenditures rose from $21.55 per person in 1982 to $22.55 in 1984. Weekly spending per person for food consumed at home increased from $14.08 to $14.52 and from $7.48 to $8.03 for food consumed away from home. Tabulations are presented for 133 food categories by 10 household socioeconomic characteristics for calendar years 1982, 1983, and 1984. The data are from the 1982-84 Continuing Consumer Expenditure Survey prepared by the Bureau of Labor Statistics, U.S. Department of Labor. A total of 63 tables are included. (Author/KC)

HIGHLIGHTS

Average weekly total food expenditures rose from $21.55 per person in 1982 to $22.55 in 1984. Weekly spending per person for food consumed at home increased from $14.08 to $14.52 and from $7.48 to $8.03 for food consumed away from home. The share of households that purchased items during a week from each major food group remained about the same over the 3 survey years. The specific items those households bought within the major food groups varied considerably, however.

Other highlights of this report are:

- Household size--Married couples with children spent less per person on both food eaten at home and away from home. Single-parent households headed by men spent more per person than those headed by women for total food and food consumed away from home. One-person households spent more than the national average both for food consumed at home and for food consumed away from home. Larger households, however, were more likely to purchase a wider variety of food items than were smaller ones.

- Geographic location--Food spending varied with the location of residence. Residents of the Northeast and West spent the most per person on food consumed at home. Residents of standard metropolitan statistical areas (SMSA´s) spent more on total food, food consumed at home, and food consumed away from home than residents of other urban areas.

- Income--Average per person food expenditures increased as income levels increased. In 1982, households in the lowest 20 percent of the income distribution spent $12.09 per person for food at home compared with $16.72 for households in the highest 20 percent. Wealthier households generally spent more on most food items and purchased a greater variety of foods.

- Race--In 1982, 1983, and 1984, blacks spent less per person on food consumed at home, food consumed away from home, and dairy products than whites. Blacks spent more on poultry products, pork, and on fish and shellfish.

- Age--Per person spending for food consumed at home tended to increase with the age of the head of the household, up to 65 years old. Elderly heads of households (those over 64 years old) spent less per person on food consumed away from home than younger heads of households. However, elderly heads of households spent more than the national average on total food as well as on food consumed at home.

- Season--Seasonal purchases varied more per person for items with seasonal production patterns, such as fresh fruits and vegetables, and for products used heavily during holiday periods, such as sugar and alcoholic beverages. Major food groups showed less seasonality than subgroups. Households were more likely to purchase bacon during the winter than in the summer. Households bought fresh tomatoes less frequently in the fall than in the spring, possibly because of the prevalence of home gardening. Ice cream and beverage purchases also varied seasonally.

Food Spending in American Households, 1982-84

INTRODUCTION

Using the per person food spending information in this report, one can determine the similarities and disparities in spending habits of households of differing sizes, races, incomes, geographic areas, and other socioeconomic and demographic features. This information is valuable for assessing existing market conditions, product distribution patterns, consumer buying habits, and consumer living conitions. Combined with demographic and income projections, this information may be used to anticipate consumption trends. The information may also be used to develop typical market baskets of foods for special population groups, such as the elderly. These market baskets may, in turn, be used to develop price indices tailored to the consumption patterns of these population groups.

This report presents weekly per person food expenditures of urban households and the percentage of households purchasing selected food items in a week, tabulated by selected socioeconomic and demographic characteristics for 1982, 1983, and 1984. These tabulations are based on data from the Continuing Consumer Expenditure Survey (CCES) conducted by the Bureau of Labor Statistics (BLS), U.S. Department of Labor. Our tabulations provide more food item detail than is available in BLS Bulletin 2245, Consumer Expenditure Survey: Diary Survey, 1982-83, published in 1986. The CCES contains the most recent and comprehensive data available on food spending by Americans.

This report updates Food Spending in American Households, 1980-81 (SB-731), published in 1985. These reports are similar in design and content and, taken together, provide a continuous series of information on food expenditures.

The CCES evolved from consumer expenditure surveys of American households that BLS has been conducting periodically at about 10-year intervals since 1888. A major objective of the first consumer expenditure surveys was to collect information necessary to construct the old Cost-of-Living Indexes and the current Consumer Price Indexes. However, with the rapidly changing economic conditions of the seventies, BLS found that the decennial surveys are inadequate. BLS initiated a continuing survey of consumer expenditures in late 1979 and expanded the objectives to include a continuous flow of information on the buying habits of Americans not only for use in revising the Consumer Price Index but also for use in a variety of research by government, business, labor, and academic analysts.

CONTINUING CONSUMER EXPENDITURE SURVEY [1]

The CCES comprises two components, each with its own questionnaire and sample: (1) an interview panel survey in which each of approximately 5,000 households are surveyed every 3 months over a 1-year period, and (2) a diary survey of approximately the same sample size in which households keep an expenditure diary for two consecutive 1-week periods. The survey treats consumer units rather than households. However, unless it is clearly specified otherwise, the two terms are used synonymously in this report. See the following Definitions section for a detailed explanation of the differences.

The interview panel survey obtains data on large and infrequent expenditures, such as for real property, automobiles, and major appliances, and those which occur on a regular basis, such as rent, utilities, and insurance premiums. Personal expenditures, including those for food on trips, are also included. Respondents can typically recall these expenditures over a 3-month period.

The diary survey obtains data on small, frequently purchased items that are normally difficult to recall, including food and beverages, tobacco, housekeeping supplies, nonprescription drugs, personal care products and services, fuels, and utilities. This diary survey excludes expenditures incurred while respondents are away from home overnight or longer.

Several features of the 1980-84 survey differed from the surveys BLS conducted for 1960-61 and 1972-73. First, only the urban population has been continuously represented in the CCES because rural sampling units were dropped from the sample in 1981, due to budget limitations, but reinstated in 1984. To maintain comparability across survey years, only the urban portions of the 1980 and 1984 surveys are used. Second, the new sample size was approximately half that of the previous two surveys, so the estimates were subject to greater sampling error. Third, the collection of information on expenditures of college students changed. In the CCES, students living in college or university housing were sampled directly, while in the 1972-73 CES, this group's expenditures were reported by their parents or guardians. Last, the new survey defined the "head" of a consumer unit using the term "householder" or "reference person," who was the first member of the household mentioned by the respondent as an owner (or renter) of the premises at the time of the initial interview. In previous surveys, husbands were automatically considered to be the heads of consumer units in which both a husband and a wife were present.

This report is based on data collected in the diary component of the 1982-84 BLS survey as reported in public-use data tapes available from BLS.

DEFINITIONS

The following terms, some of which occur frequently in the accompanying tables, are briefly defined.

---

[1] Technical descriptions of the BLS-CCES and definitions draw heavily from Consumer Expenditure Survey: Diary Survey 1980-81, Bulletin 2173, Bureau of Labor Statistics, U.S. Department of Labor, 1983, and Consumer Expenditure Survey: Diary Survey 1982-83, Bulletin 2245, Bureau of Labor Statistics, U.S. Department of Labor, 1986.

Population

Population--The U.S. civilian noninstitutional urban population, as well as that portion of the institutional population living in the following group quarters: boarding houses, housing facilities for students and workers, staff units in hospitals and homes for the aged, infirm, or needy, permanent living quarters in hotels and motels, and mobile home parks.

Standard Metropolitan Statistical Area (SMSA)--Except in New England, an SMSA is a county or group of contiguous counties which contain at least one city of 50,000 inhabitants or more or "twin cities" with a combined population of at least 50,000. In addition to a county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns or cities, rather than counties.

Urban Population--All persons living in SMSA's and in urbanized areas and urban places of 2,500 or more persons outside of SMSA's. The term "other urban" is used in this report to describe that portion of the population living outside of SMSA's.

Student Population--Students living in college or university housing, usually dormitories.

Primary Sampling Unit (PSU)--Usually a county or group of contiguous counties, except in certain areas of the Northeast where a PSU is a cluster of towns. A PSU may include both urban and rural areas as well as farm and nonfarm areas.

Geographic Regions--Data are presented for four major regions: Northeast, Midwest, South, and West. Consumer units are classified by these regions according to the address at which the household was residing during the time of their participation in the diary survey. These regions comprise the following States:

> Northeast--Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.
>
> Midwest--Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.
>
> South--Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.
>
> West--Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

In the 1980-81 CCES, the Midwest was termed the North Central region. Both names represent the same region and include the same States.

Consumer Unit (Household)

Consumer Unit--A consumer unit, the basic reporting unit for the diary survey, comprises (1) all members of a particular household who are related by blood, marriage, adoption, or other legal arrangement such as a foster child; (2) a financially independent person living alone or sharing a household with others, living as a roomer in a private home or lodging house, or living in permanent quarters in a hotel or motel; or (3) two or more persons living together who pool their income to make joint expenditure decisions.

Financial independence is determined by three major expense categories: housing, food, and other living expenses. To be considered financially independent, the respondent must provide at least two of the three major expense categories.

Householder--The first household member mentioned by the respondent when instructed to "Start with the name of the person, or one of the persons, who owns or rents the home." The relationship of other consumer unit members is determined with respect to this person.

Size of Household--The number of persons who normally make up the consumer unit at the sample address.

Age of Householder--The actual age of the householder at the time the diary is placed in the household.

Number of Earners--All consumer unit members, 14 years and older, who report having worked at least 1 week during the 12 months prior to the interview date are classified as earners. This measure will tend to overstate the number of earners employed on a regular basis.

Number of Vehicles--The number of automobiles, trucks, and other vehicles owned by all members of the unit, including vehicles used partially for business but excluding those used entirely for business.

Income

Total Income--The combined income earned by all consumer unit members 14 years old or over in the 12-month period prior to the last day of participation in the survey. The components of income are wages and salaries, net business and farm income, Social Security and other pension income, interest, dividends and other asset income, and other income. Other income includes (1) Supplemental Security Income paid by Federal, State, and local welfare agencies to low-income persons who are 65 years or older, blind, or disabled; (2) income from unemployment compensation; (3) income from workers' compensation and veterans' payments, including education benefits but excluding military retirement; (4) public assistance or welfare, including money received from job training grants; (5) alimony and child support as well as any regular contributions from persons outside the consumer unit; (6) money income from care of foster children, cash scholarships, fellowships, or stipends not based on working; and (7) the purchase value of food stamps.

Complete Income Reporting--The distinction between complete and incomplete income reporting is based on whether the respondent provides information on wages and salaries, self-employment income, and Social Security income. Even complete income reporters may not provide a full accounting of all income from all sources.2/ Income tabulations in this publication are based only on consumer units with complete income data.

Top Coding of Income--Individual components of consumer unit annual income that exceeded $75,000 in the 1982 survey and $100,000 in the 1983 and 1984 surveys are coded in the public-use data tapes as $75,000 and $100,000 to satisfy Federal regulations set up to protect the identity and privacy of survey participants. Top coding of income leads to a downward bias in the estimate of average income.

Quintiles of Income Before Taxes--Each quarter, respondents that provide income reports are ranked in ascending order according to the level of total before-tax income reported by the consumer unit. The ranking is divided into five equal groups called income quintiles, and the data for each of the four quarters are then combined. Consumer units providing incomplete income reports are not ranked and are shown separately in all income tables.

EXPENDITURE ESTIMATES

Expenditures are the transaction costs, including excise and sales taxes, of goods and services acquired during the recordkeeping period. The respondent records the full cost of each purchase even though full payment may not have been made on the date of purchase. The expenditure estimates exclude purchases made while away from home overnight, purchases directly assignable to business use, and periodic credit or installment payments on goods or services already acquired.

Major food and beverage expenditure categories and subgroups that appear in this report are displayed in tables 3-62.

Several factors should be considered when relating individual household circumstances (such as region of residence and race of householder) to the expenditures shown in the tables. First, the expenditures are averages for all urban households with the specific characteristics, regardless of whether or not a particular household purchased the specific food item during the recordkeeping period. The average expenditure may be considerably below the expenditure by those households that purchased the item. The less frequently an item is purchased, the greater the difference between the average for all households and the average for those households that purchased the item. Even if such purchases were made, an individual household may have spent more or less than the average. Even within groups with similar characteristics, the distribution of expenditures varies greatly. Also, many factors such as income, age of household members, and geographic location of residence influence expenditures and are not held constant within any given table.

2/ The current definition of "complete income reporting" is different from the 1972-73 definition. A consumer unit reporting zero income in 1972-73 was considered a complete respondent as long as there was no evidence of intent to refuse the income question. In the 1982-84 survey, across-the-board zero income reporting was designated as invalid by BLS, and the consumer unit was categorized as an incomplete reporter. Neither survey, however, accounted for possible underreporting. Consumer units designated as incomplete reporters of income are excluded from computations of average income in this report.

The share of total expenditures of an item shown in the accompanying tables for a particular population segment can be readily calculated. The following procedures are employed, for example, to estimate the share of national total food expenditures accounted for by two-member households. First, multiply the average total per person food expenditures for two-member households ($25.88, from table 9) times the number of two-person households in the United States (19,925, from table 9) times the average number of persons in the households (2, from table 9). Then, divide this result by the product of the average U.S. household size (2.5, from table 9) times the total number of households in the U.S. (72,812, from table 9) times the average total per person food expenditures ($21.55, from table 9). The result of these operations is the share of national food expenditures accounted for by two-member households. Mathematically,

$$\text{Share of national food expenditures accounted for by two-person households} = \frac{\$25.88 \times 19{,}925 \times 2}{\$21.55 \times 72{,}812 \times 2.5} = 26 \text{ percent.}$$

We can use similar procedures to estimate the share of the total population accounted for by two-member households:

$$\text{Share of total population composed of two-member households} = \frac{19{,}925 \times 2}{72{,}812 \times 2.5} = 22 \text{ percent.}$$

Thus, two-member households are 22 percent of the population, but their share of national food expenditures is 26 percent.

SURVEY PROCEDURES

This section discusses the technical details concerning the CCES sample design, geographic coverage, sampling frame, level of participation, sample weighting factors, data collection, and data processing.

Sample Design

Data for the CCES were obtained from a nationwide probability sample of households designed to represent the total civilian noninstitutional urban population. The sample consisted primarily of persons living in regular housing units and some selected group quarters such as college dormitories.

Geographic Coverage

A sample of geographic areas called primary sampling units was selected for the survey. The set of sample PSU´s consisted of 101 geographic areas, 85 of which were urban areas that were previously defined and selected for the BLS Consumer Price Index. The PSU´s were placed in five categories: "A" PSU´s, which comprised 27 "certainty" areas (for example, they were self-representing) and were primarily large SMSA´s; "B" PSU´s, which comprised 20 SMSA´s, each with a total 1970 population of more than 400,000; "C" PSU´s, which comprised 22 SMSA´s with a total 1970 population of 400,000 or less; "D" PSU´s, which comprised 16 urban places in all areas outside of SMSA´s; and "E" PSU´s, which comprised 16 rural areas. BLS followed a controlled selection procedure to ensure proper geographic distribution of the selected PSU's. The rural portion of the sample was dropped in 1981 for budgetary reasons but reinstated in 1984.

Sampling Frame

The sampling frame for the survey was developed from the Bureau of the Census' 100-percent-detail file (1970 census) augmented by new construction permits and techniques used to eliminate recognized deficiencies in coverage in that census. All enumeration districts (ED's) from the 1970 census that failed to meet the criterion for good or available addresses for new construction and all ED's in areas that do not issue permits are grouped into the area segment frame. Housing units designated for interview were distributed evenly throughout the year, except for the last 6 weeks of the year, when the sample was augmented to account for substantially increased buying activity during the holiday season.

Level of Participation

Approximately 7,700 consumer units were scheduled for selection in each year of the diary survey. Of these units, some were found to be vacant, nonexistent, or ineligible for the period and thus were not surveyed. Of the remaining units, some were not contacted by the interviewer, some refused to participate, and some were temporarily absent for reasons such as vacations. Sample units with occupants that were temporarily absent were included in the final sample. These consumer units, along with those from whom data were collected, made up the eligible sample in each survey year. Response rates were approximately 91 percent of the eligible sample.

Weighting

Weights were assigned to each consumer unit participating in the survey in order to provide estimates for the U.S. urban population. These weights, derived from the urban control totals of the Current Population Survey, were a product of several factors: the probability of selecting the housing unit; a December seasonal factor; a factor to adjust for subsampling in the field; a noninterview adjustment; a national ratio-estimate adjustment for age, sex, and race to urban civilian, noninstitutional population controls; and a final adjustment based upon family composition. The weighting process was performed each month on diaries beginning within the month, and each week's interview was weighted separately. An improved weighting method, generalized least squares (GLS), was used in the 1984 survey. The GLS method will be used in all subsequent surveys.

Data Collection

The Bureau of the Census collected the data for BLS. At the beginning of the 2-week collection period, the Census interviewer used the household characteristics questionnaire to record information on the age, sex, race, marital status, education, and family relationships of members of the sample unit. At this time, the interviewer also left the diary questionnaire, or daily expense record, with the consumer unit. The diary questionnaire, designed as a self-reporting, product-oriented diary, was used by respondents to record all expenses incurred during participation in the survey. The questionnaire was divided by day of purchase and by broad categories of goods and services.

At the end of the first week, the interviewer picked up the diary, reviewed the entries, clarified any questions, and left a second diary. At the end of the next week, the interviewer picked up the second diary and reviewed the entries.

At the same time, the interviewer again used the household characteristics questionnaire to collect previous-year information on the work experience, occupation, industry, retirement status, earnings from wages and salaries, net income from business or profession, net income from one's own farm, and income from other sources. This information was collected, along with the other household characteristics data, to permit (1) classification of families for analysis, (2) determination of eligibility of the family for inclusion in the population covered by the Consumer Price Index, and (3) adjustment for the lack of response by families who did not cooperate in the survey.

Data Processing

The Bureau of the Census performed a preliminary set of clerical processing activities, including a number of critical data edits and adjustments. During a field edit, data in the diaries were reviewed for completeness and consistency. All notes were reviewed so that expenditure data could be transcribed to the questionnaire for keypunching. Item codes were assigned to the reported expenditure items, household and consumer unit codes were assigned to each family member, and industry and occupation codes were entered for each working family member. At the completion of the clerical processing activities, the data were keypunched and loaded onto computer tapes.

The data were then processed by computer to calculate population weights based on BLS specifications, to impute demographic characteristics for missing or inconsistent demographic data, to impute values for weeks worked when a nonresponse was encountered, and to apply appropriate sales taxes to the expenditure items. Finally, a computer file containing these data was produced and transmitted to BLS on a monthly basis.

As the monthly diary data tapes were received, BLS created a quarterly data base which was screened for invalid coding, inconsistent relationships, and extreme values that may have been recorded or keypunched erroneously. Coding and extreme-value errors were corrected before BLS processed the tapes further.

BLS subjected selected portions of the diary data to automated imputation and allocation routines when respondents reported insufficient detail to meet publication requirements. The imputation routines assigned qualifying information to data items when an invalid nonresponse was evident. Allocation routines were also performed to transform reports of nonspecific items into specific ones. For example, when respondents reported expenditures for meat rather than beef or pork, allocations were made using proportions derived from item-specific reports in other completed diaries.

Finally, BLS processed income data through a routine that identified and coded the data as either complete or incomplete. This distinction was based on a well-defined set of rules for reporting the types of income received by individual members and the consumer unit as a whole. Even though incomplete reporting was identified, income was not imputed; however, BLS is considering imputing income.

CCES AND OTHER DATA SOURCES

The U.S. Department of Agriculture (USDA) conducts comprehensive household surveys of food consumption approximately every 10 years. The most recent is the 1977-78 Nationwide Food Consumption Survey (NFCS), which differs in several respects from the 1982-84 CCES. The most notable difference, other than the survey years, is that the NFCS measures food consumption during the survey period, while the CCES measures purchases. Differences may thus occur due to the value of nonpurchased foods, such as homegrown food and food received as a gift or as pay. These items are included in the NFCS but not in the CCES. Differences also arise because of the timing of consumption versus purchases and changes in household food inventories. However, the disparities among households due to inventory changes tend to average out when tabulations cover large groups of consumers.

Another difference between the two surveys is the unit of observation. USDA uses the household as the observational unit, whereas BLS uses the consumer unit. Although these are largely the same, differences between units classified by living arrangements and economic consuming units will exist, as in the instance of unrelated, economically independent individuals living together.

Population coverage also differs between the two surveys because the NFCS excludes individuals in group dwellings, such as college students living in dormitories, whereas the CCES includes them.

Many USDA tabulations of the NFCS data include only housekeeping households in which at least one member consumed 10 or more meals from home food supplies during the 7-day survey period. Because housekeeping households consume more home food supplies than do nonhousekeeping households, food expenditure estimates based solely on housekeeping households tend to overestimate at-home consumption and underestimate away-from-home consumption. Survey estimates suggest that about 6 percent of the civilian noninstitutional population covered by the NFCS are nonhousekeeping households.

The NFCS data also include food purchased at restaurants, carryouts, and similar types of establishments and carried home for consumption in at-home food expenditures. In the CCES, these types of expenditures are included in away-from-home food spending.

An obvious difference between the NFCS and CCES is the time period of the surveys, 1977-78 and 1982-84. Differences in economic conditions, such as prices, product availability, and consumer purchasing power, will contribute to observed differences in the reported data.

The personal consumption expenditures (PCE) data are a component of the gross national product accounts, prepared quarterly by the U.S. Department of Commerce and published in Survey of Current Business. The PCE series measures personal expenditures on a national level for all newly produced goods and services.

These estimates are based on business and government sources rather than household interviews. The source and derivation of the PCE estimates thus hardly resemble the CCES estimates. The PCE estimates are also based on the total population, while the CCES estimates are based only on the urban component.

Benchmark estimates for the PCE series are developed approximately every 5 years based on the flow of goods and services through the economy. Personal consumption expenditures for food, for example, are derived by adding transportation costs and wholesale and retail trade markups to manufacturer's prices. Additional adjustments are made for exports, imports, and changes in inventories. Between benchmark years, the various components of the PCE series are updated using survey information on sales of eating and drinking establishments and estimates of grocery store sales. Other minor adjustments are also made. The primary data are from the Censuses of Manufactures, Transportation, and Business.

When placed on an annual per capita expenditure basis, estimates from the CCES are consistently less than those reported in each of the following PCE food components: total food, food consumed at home, and food consumed away from home. The relative difference is greater for food consumed away from home than for food consumed at home, probably because the diary component of the CCES does not include expenditures on food when the respondent is away from home overnight or longer. Disparities between the estimates for expenditures on alcoholic beverages are even larger, but this result is expected because full disclosure of alcoholic beverage consumption is extremely difficult to obtain in household surveys.

The PCE and CCES estimates of per capita annual income also differ, with the CCES income estimates being lower. This difference is consistent with the notion that income is generally underreported in household surveys.

A detailed description of the derivation of the PCE series is available in Development of National Income Measures, Supplement to Survey of Current Business (U.S. Department of Commerce, Bureau of Economic Analysis, 1954). A detailed comparison with the CCES data is reported in BLS Bulletin 2245 (see footnote 1, p. 2).

DATA LIMITATIONS

Data in this report are based on a sample of consumer units and may differ somewhat from the figures that would be obtained if a complete census of consumer units had been taken. The variability of sample estimates is a function of sample design and sample size and generally decreases with larger size samples and aggregation over product categories. Expenditure estimates for broader expenditure groups and larger population groups will generally be subject to smaller sampling variation than expenditure estimates for narrower expenditure and population subgroups. The coefficient of variation (CV), expressing the standard deviation as a percentage of the sample estimate, is a commonly used measure for comparing the relative variability of sample estimates. CV's for the various detailed estimates of weekly per person food expenditures presented in this report for the total urban population are given in table 63.

The estimates are also subject to sampling biases that may result from the selection of households, the recording of information, and the interpretation of information. The long and extensive experience of BLS in conducting surveys of this type, however, helps to minimize these sampling biases.

Identifying and handling incomplete questionnaires introduce another potential source of bias. In the CCES diary, identifying incomplete expenditure reporting is particularly difficult because respondents are required to report only items actually purchased. No action is required on items not purchased during the survey. Distinguishing between an incomplete expenditure diary and one in which the respondent records only a few purchases is difficult. Incomplete reporting on other sections of the survey may be associated with incomplete expenditure diaries. For example, homeowners not reporting a mortgage status are about half as likely to report purchases for most food items as those homeowners reporting a mortgage status. A similar pattern, but not nearly as pronounced, is observed for consumer units with incomplete income reporting. Because of these reporting phenomena, we advise utmost caution in any further use of the tabulations in this report for these two subgroups of consumer units.
